GENERAL NOTES:

Specifications:

AASHTO LRFD Bridge Design Specifications, 10th Edition.

AASHTO Guide Specifications for Wind Loads on Bridges During Construction, 1st Edition.

Materials:

*Girder Webs and Flanges*

ASTM A709 Gr 50W or Gr HPS 70W as noted in the plate size tables

Gr HPS 70W flanges are noted with a ▲

*Stiffeners*

A709 Gr 50W

Intermediate transverse shear stiffeners, single sided

Stiffener sizes shown as required by design,  $\frac{1}{2}$  in. minimum thickness

*Lateral Bracing and Diaphragm / Crossframe Members*

ASTM A709 Gr 50W

*Concrete Deck*

$f_c = 4$  ksi

*Reinforcing Steel*

$F_y = 60$  ksi

*Bolts*

ASTM F3125 Grade A325, diameter provided on detail sheets

Loading:

*Live Load*

Live load is the controlling force effects from:

HL93

EV3 - Present in multiple lanes

Fatigue design based on  $ADTT_{sl} = 1000$  trucks per day

*Dead Load*

Dead load assumptions:

For DC1

Slab thickness as shown in plans

Overhang thickness = slab thickness + 4 in.

Concrete haunch weight, 50 plf per beam

Stay-in-place form allowance, 15 psf

Miscellaneous steel weight:

8 ft girder spacing - 30 plf

10 ft girder spacing - 30 plf

12 ft girder spacing - 30 plf

14 ft girder spacing - 45 plf

Total DC1 loads shown on this sheet are computed with the above assumptions and assuming equal loading to all beams in the cross-section.

For DC2

Assumed single slope TL5 railing

600 plf divided to two beams

For DW

2 in. asphalt at 140 pcf

*Final Design Dead Loads*

8 ft girder spacing designs:

DC1 = 930 plf

DC2 = 300 plf

DW = 160 plf

10 ft girder spacing designs:

DC1 = 1,220 plf

DC2 = 300 plf

DW = 200 plf

12 ft girder spacing designs:

DC1 = 1,540 plf

DC2 = 300 plf

DW = 240 plf

14 ft girder spacing designs:

DC1 = 2,000 plf

DC2 = 300 plf

DW = 280 plf

Note: exterior girders also designed for flange lateral bending moments from overhang brackets and concrete deck finishing machine. Flange lateral bending moments for exterior beams are provided on the **Fascia Beam Design Criteria** sheet.

*Wind Load*

Wind on completed bridge 44 psf

Wind on open framing during construction, see **General Design Criteria** sheet.

**GENERAL NOTES**

Issued January 2025  
Revision 0

Sheet 2 of 32

## Design Assumptions and Criteria, Continuous Span Bridges:

1. Girder Design
  - a. All designs performed using NSBA LRFD SIMON.
  - b. Interior and exterior beams were designed. In LRFD SIMON, the "BOTH" option is used for the LL distribution factors. This results in a single beam designed for the governing shear and moment distribution factors for an interior and exterior beam. The composite slab effective width is based on an exterior beam.
  - c. Live load distribution follows AASHTO LRFD 4.6.2.2 for all beam spacings and span lengths. Designs where the AASHTO distribution factor equations are used beyond the range of applicability are noted in the design tables.
  - d. A skew of 20 degrees from normal is assumed for all designs.
  - e. Live load deflection satisfies AASHTO LRFD 2.5.2.6.2 Criteria for Deflection for vehicular bridges, L/800.
  - f. Girder depth satisfies AASHTO LRFD 2.5.2.6.3 Optional Criteria for Span-to-Depth Ratios.
  - g. Fatigue design based on Category C for shear studs welded to top flanges and Category C' for welded transverse stiffeners,  $ADTT_{SL} = 1,000$  vehicles per day and a 75-year design life.
  - h. Maximum segment length, 140 feet.
  - i. Three-span-continuous units are designed for end span lengths equal to 78% of the center span length.
  - j. All continuous span bridges have field splices adjacent to each pier at approximately 0.7L of the end span.
  - k. Some continuous span bridges have additional splices at approximately 0.25L of the end span to meet shipping length requirements. These are noted in the plans.
  - l. Maximum shipping weight, 50 tons.
  - m. Maximum web depth, 11 feet.
  - n. Minimum top flange width,  $b_{tfs} \geq L_{fs} / 85$  where  $L_{fs}$  is the field section length. AASHTO LRFD (C6.10.2.2-1).
  - o. Flange widths held constant in a field section.
  - p. Minimum flange thickness, 1 in. Maximum flange thickness, 3 in. Flange thickness increments, 1/4 in.
  - q. Minimum web thickness, 1/2 in. Web thickness increments, 1/8 in.
  - r. No more than two complete joint penetration flange butt welds per flange in any field section.
  - s. When a single size flange is used in a field section, the weight reduction of a complete joint penetration transition was first evaluated and then eliminated based on weight, cost, and stress considerations.
  - t. Single-sided transverse shear stiffeners are used when needed.
  - u. Longitudinal stiffeners are not used.
  - v. All girders are composite for positive and negative bending.
  - w. Negative moment longitudinal deck reinforcing is 1% of the gross deck cross-section. This reinforcing extends at least between the field splices, or longer as required by AASHTO LRFD 6.10.1.7 for the Service II Limit State. Designer to determine if the factored deck casting and construction loads require this reinforcing steel to be extended. See the **Deck Details** sheets for additional details.
  - x. Shear stud design based on LRFD SIMON and AASHTO LRFD 9th edition. For flanges  $\leq 16$  in. wide, three 7/8 in. diameter studs in a transverse row are used. All other flange widths use four studs in a transverse row.
2. Diaphragm and Cross-Frame Design
  - a. Intermediate diaphragms and cross-frames are designed as below. End diaphragms or cross-frames that support the deck and/or expansion joint are not considered as part of these standards.
  - b. Diaphragm and cross-frame spacing varies within in the span. Maximum spacing does not exceed 30 ft.
  - c. Depth of bracing is at least 0.8 times girder web height.
  - d. For cross-frame design, the effective depth of the chords was assumed to be 5 in. vertically from the top and bottom of web. This dimension is used for "D" in the S/D checks. For all S/D checks, "S" is S / Cosine 20 deg assuming a maximum 20 degree skew for all designs.
  - e. Solid diaphragms are used when the girder spacing to web depth ratio, S/D > 3.5.
  - f. K-frames are used when  $1.5 < S/D \leq 3.5$ .
  - g. X-frames are used when  $S/D \leq 1.5$
  - h. Angles are used for all cross-frame members.
  - i. Cross-Frame members are designed as secondary members.
  - j. Cross-Frame members are designed for tension / compression loading.
  - k. Cross-frame member stiffness is based on 0.65AE stiffness reduction factor for eccentrically loaded angles, AASHTO LRFD C4.6.3.3.4.
  - l. Diaphragms and cross-frames are designed for combined stability-induced loads along with simultaneous deck casting forces. The finishing machine is assumed to be centered at a brace point location.
3. Wind Load Design
  - a. Lateral deflection and flange lateral bending stresses due to wind on the fully erected steel framing were evaluated. Lateral bracing is not required for the design conditions assumed in 3.1 and 3.2, below. Other conditions may require bracing for wind load deflection or stress.
- 3.1 Service Design Criteria
  - a. Lateral deflections due to wind loads on the fully erected steel satisfy the Span / 150 requirement established by PennDOT BD-620M. All references to BD-620M are to the April 29, 2016 edition.
  - b. For this deflection check, a 32 psf assumed pressure is applied to fascia beams only for a superstructure height = 30 ft. For other superstructure heights, refer to PennDOT BD-620M.
- 3.2 Strength Design Criteria

Girder flange lateral bending is checked for strength as follows:

  - a. Maximum wind load positive and negative moment regions were checked. Check other plate transitions in final design.
  - b. Fascia beam checked for global bending of the span and local bending between cross-frames.
  - c. Wind loads on erected steel determined from the *AASHTO Guide Specification for Wind Loads on Bridges During Construction, 2017*.

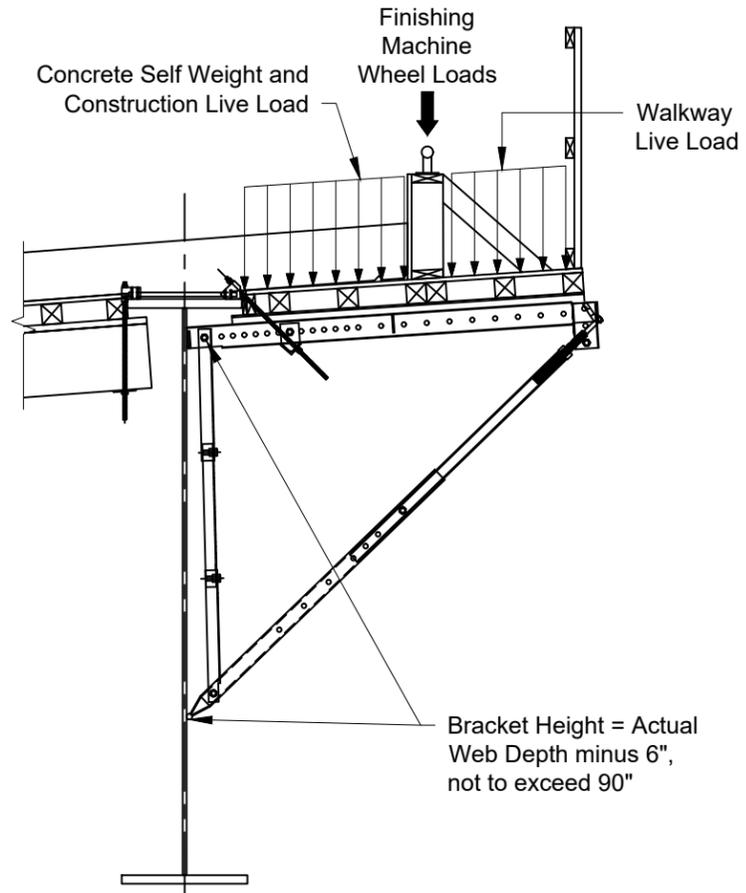

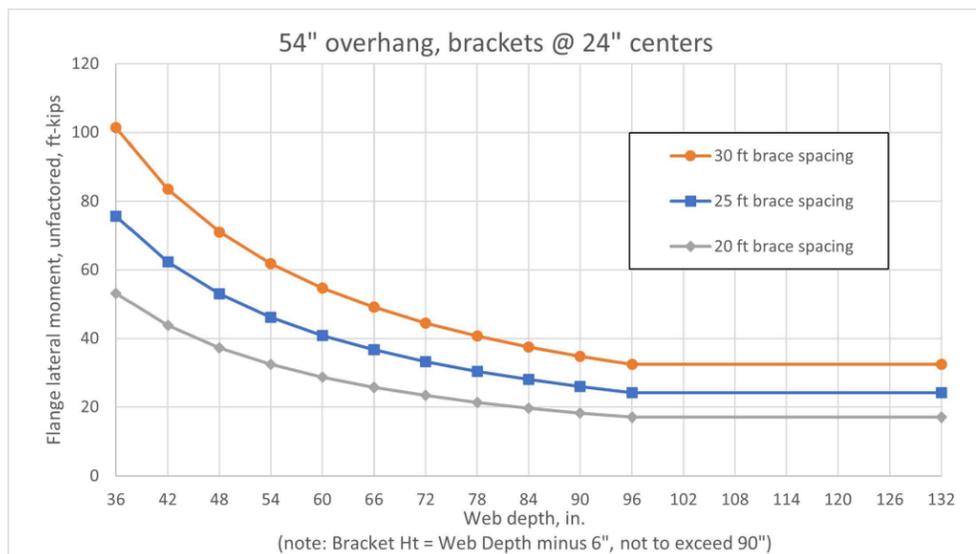

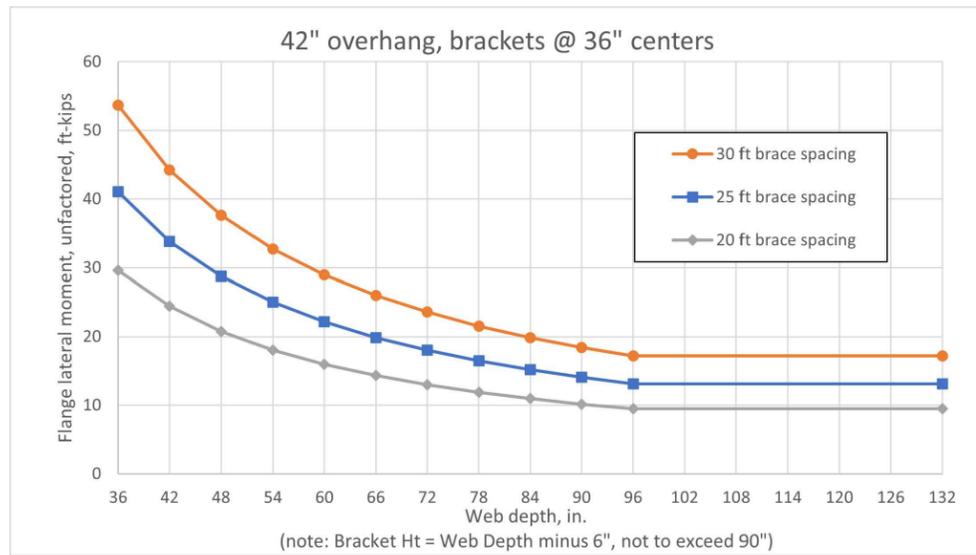

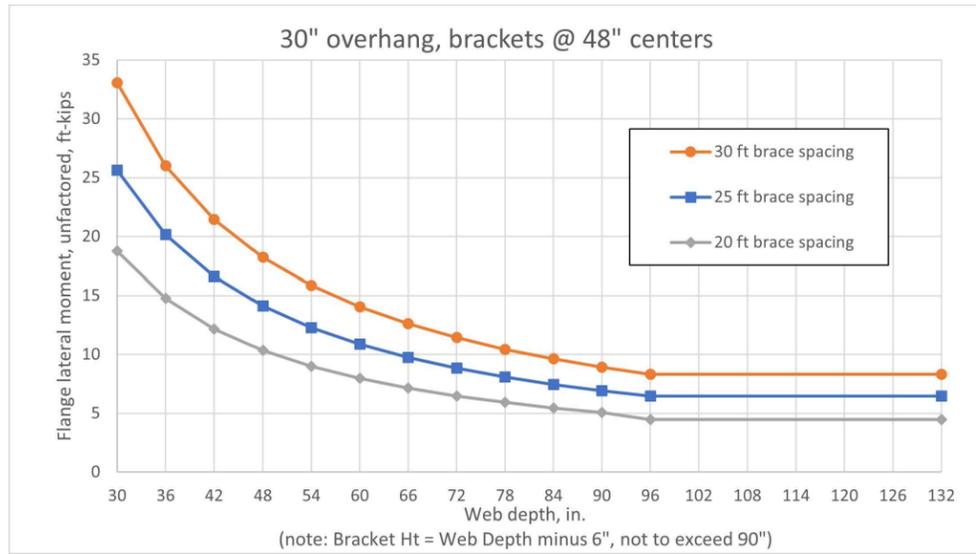

Inactive wind condition, V = 115 mph. Superstructure height, 30 ft  
Superstructure construction duration 6 weeks - 1 year, R = 0.73  
 $K_z = 1.0$ ,  $C_d = 2.2$  for fascia beam, per AASHTO Guide Specifications for other beams.
4. Bolted Field Splices
  - a. All bolted field splices use 1 in. diameter ASTM F3125 Grade A325 bolts and standard sized holes.
  - b. All connection and fill plates are Gr 50W.
  - c. Slip resistance is based on a Class B surface condition.
  - d. For connections where the bottom flange and a portion of the web are required to be in tension to resist the factored moments at the point of splice an additional check was made to determine if the slab has adequate compression strength. This check is not in AASHTO. If the slab is unable to provide a compression capacity equal to the tensile forces of the bottom flange and web in tension, the connection was designed as a noncomposite splice. If or when this situation occurs, these splices are noted "Non-Composite" in the **Bolted Field Splices** sheets. This condition was not encountered in any of the three-span standard designs.

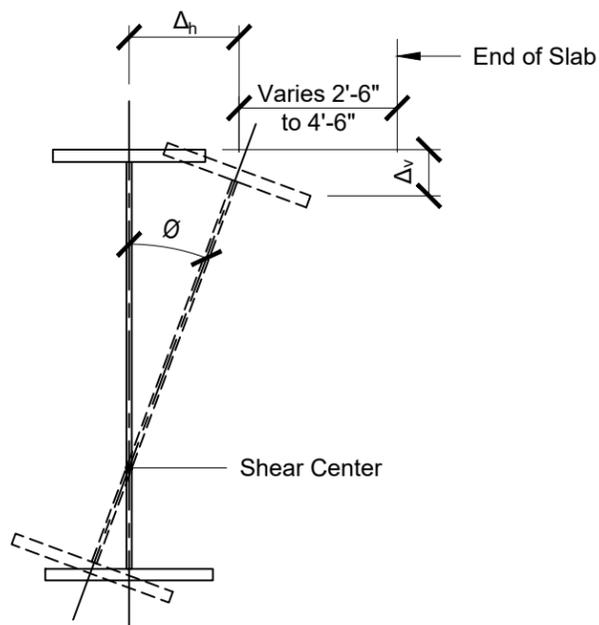

## GENERAL DESIGN CRITERIA

Issued January 2025  
Revision 0

Sheet 3 of 32

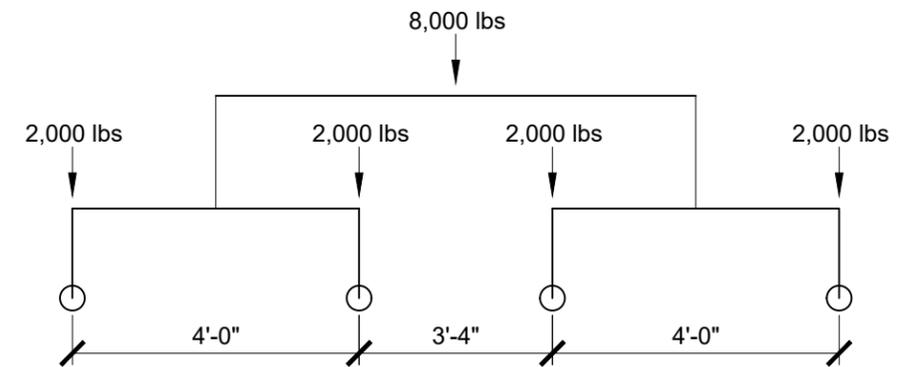

**TYPICAL SECTION**

**GIRDER ROTATION DIAGRAM**

**Fascia Beam Design Criteria:**

1. Finishing machine wheel load, 4 @ 2000 pounds. Loads shown are representative of finishing machines used for bridge widths and types shown on these plans.
2. Concrete density, 160 pcf, to account for formwork weight allowance.
3. Construction live load on deck, 50 psf.
4. Walkway live load, 50 psf. Assumed walkway width, 2 ft.
5. Overhang slab thickness equals nominal slab thickness + 4 in. assuming slab is flush to underside of top flange and an assumed 4 in. haunch.
6. Finishing machine is assumed to be midway between cross-frames for lateral bending moment calculations.
  - a. Factored load combination: AASHTO LRFD 3.4.2, 1.25 DC + 1.5 LL
  - b. An equivalent service bending moment is computed for LRFD SIMON input. LRFD SIMON uses a 1.4 factor on all lateral bending moments. Moments shown on the accompanying graphs are unfactored and are a total weighted average of the dead and live load lateral flange bending moments.
7. Bracket spacing assumed as follows. Bracket spacing is based on limiting capacities of common commercially available hangers and brackets. Assumed safe working load of 6,000 lbs. per hanger. Assumed safe diagonal load of 3,750 lbs. per diagonal.
  - a. 30 in. overhangs, 48 in. bracket spacing.
  - b. 42 in. overhang, 36 in. bracket spacing.
  - c. 54 in. overhang, 24 in. bracket spacing.
8. Girder service load rotations,  $\theta$ , are limited to 1 degree.
9. Lateral deflection at the top of web,  $\Delta_h$ , limited to 0.25 in. Vertical deflection of the edge of slab,  $\Delta_v$ , limited to 0.5 in. Both limits checked for maximum finishing machine loading and are instantaneous values.

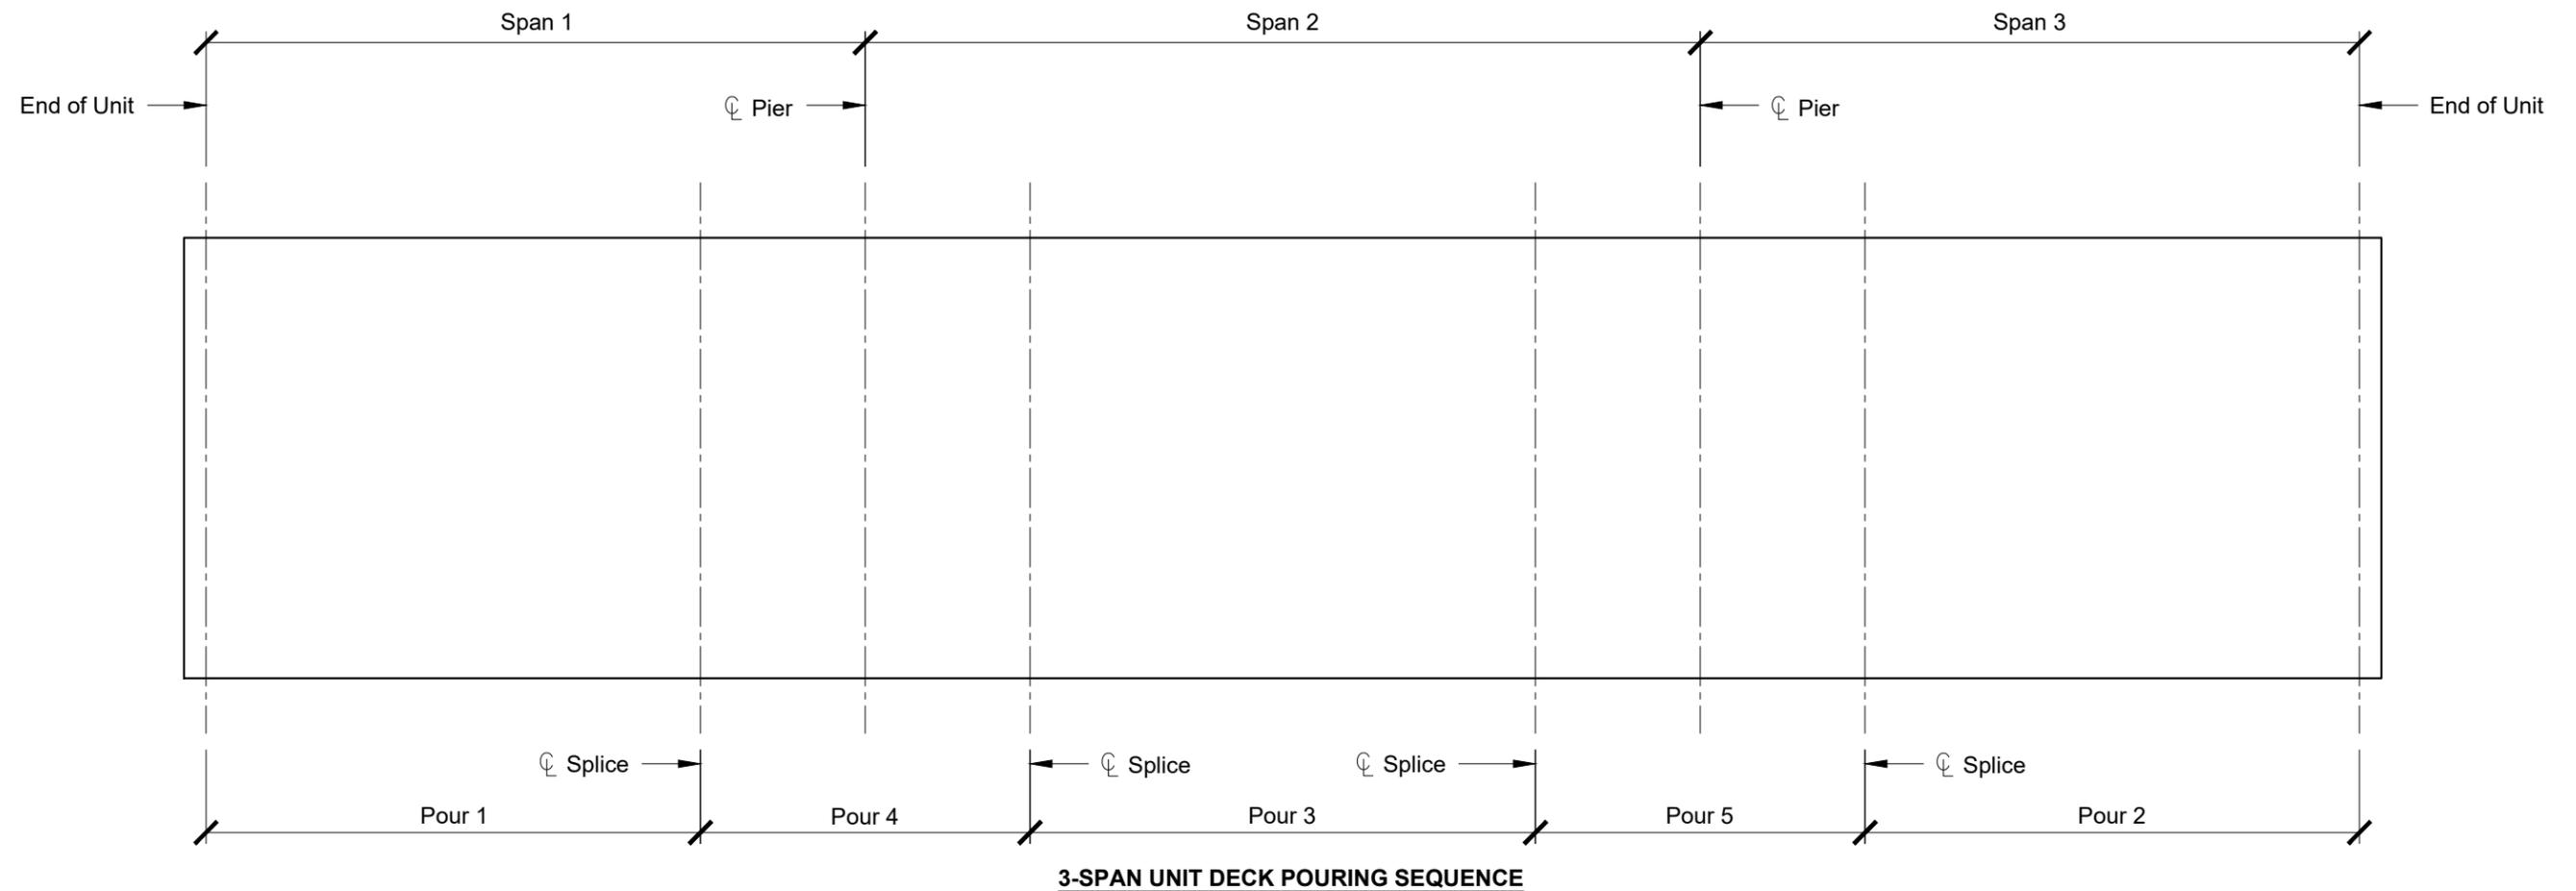

**ASSUMED FINISHING MACHINE**

**FASCIA BEAM DESIGN CRITERIA**

Issued January 2025  
Revision 0

Sheet 4 of 32

**DECK POURING NOTES**

1. The deck pouring sequence shown is the basis of design.
2. The beams are designed for local and lateral-torsional buckling limits for the specified pour sequence and additionally for the global stability and cross-frame requirements of AASHTO LRFD 10th edition Article 6.7.4.2.2.
3. For the 3-span unit, the critical checks for deck casting positive and negative bending in noncomposite sections occur during Pour 2 and 5.
4. The provisions of AASHTO LRFD 6.7.4.2.2 do not account for the stiffening influence of any previously cast and composite deck sections and are conservative for other than Pour 1.
5. Uplift is prevented in all cases.

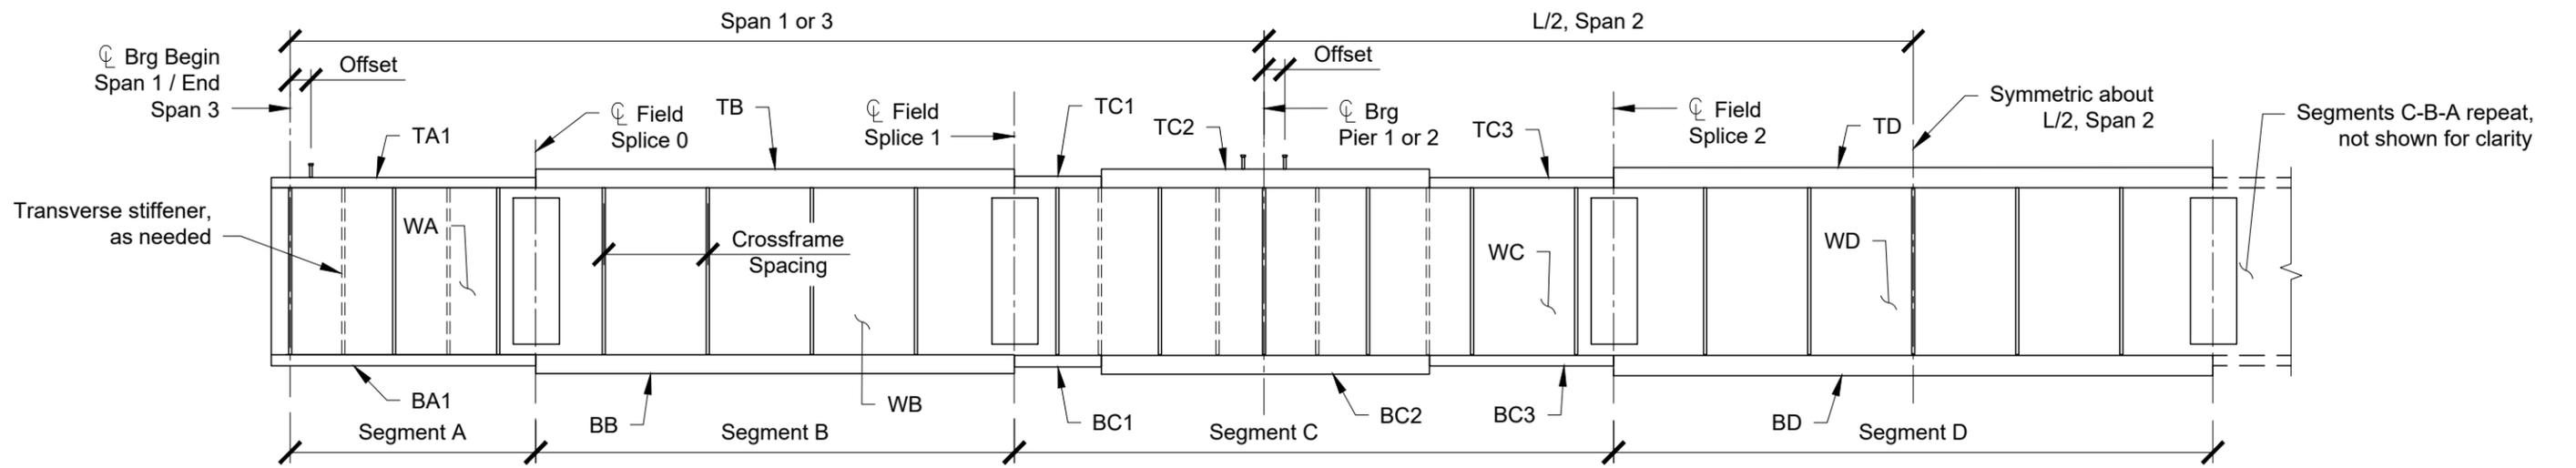

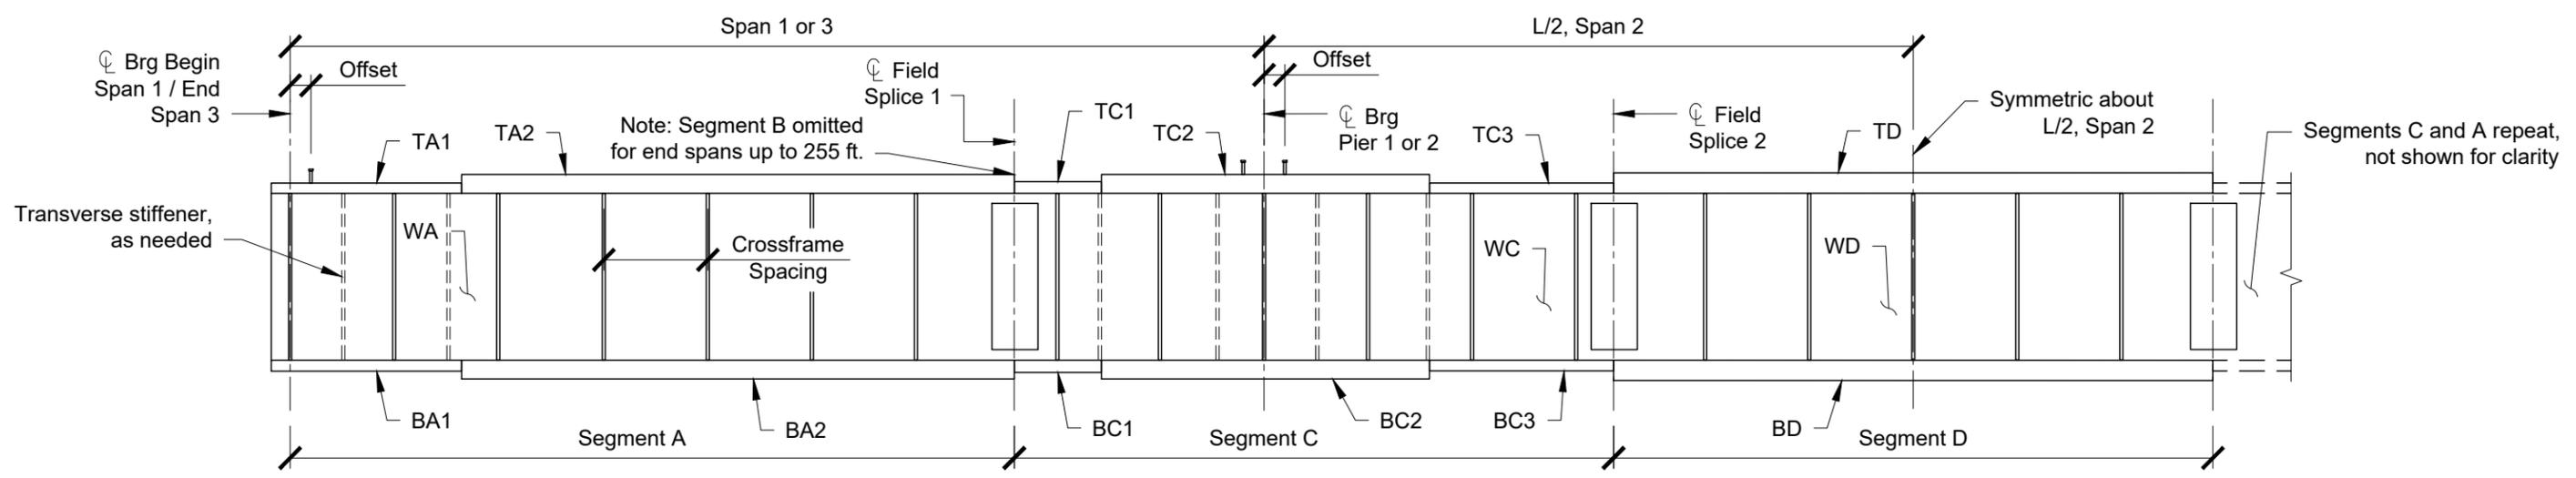

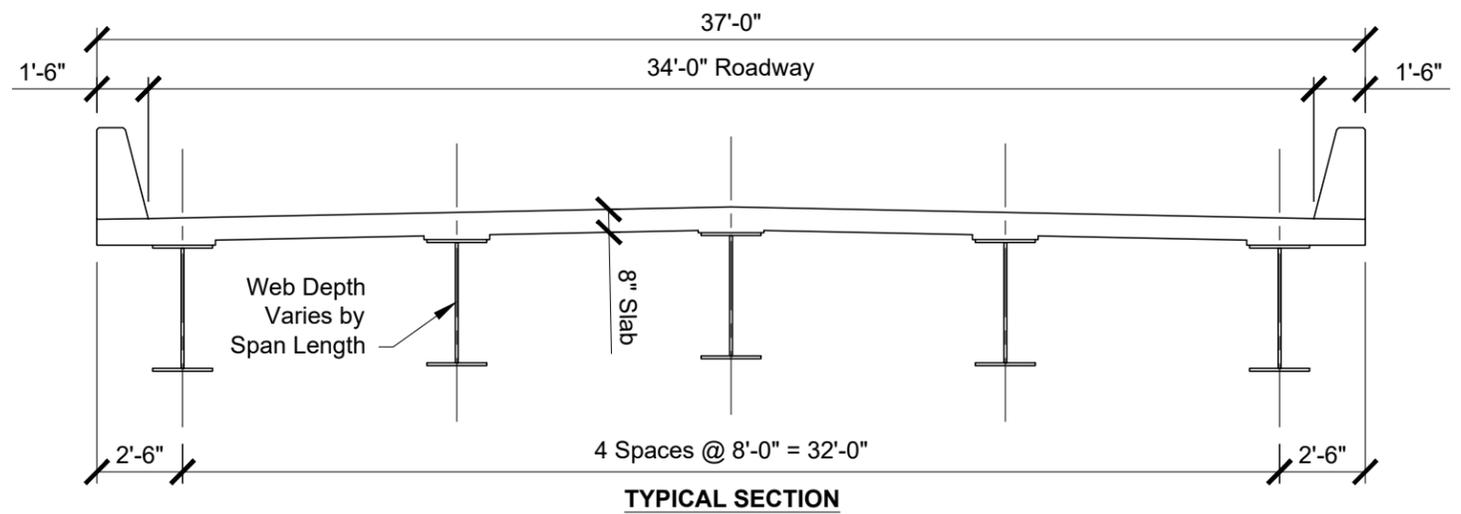

*Note: An alternate pouring sequence with the deck cast continuously end-to-end is also permitted. All girder designs in these standards satisfy stress, strength, uplift, and stability requirements for the alternate pouring sequence.*

**DEFLECTION VERSUS SPAN TENTH POINT, SYMMETRIC ABOUT L/2 SPAN 2**

Exterior and First Interior Girder

**Deflection Assumptions**

"Steel Only" = self weight of girders

"Slab" = deflection due to user-input non composite uniform dead load (slab, haunch, allowance for bracing)

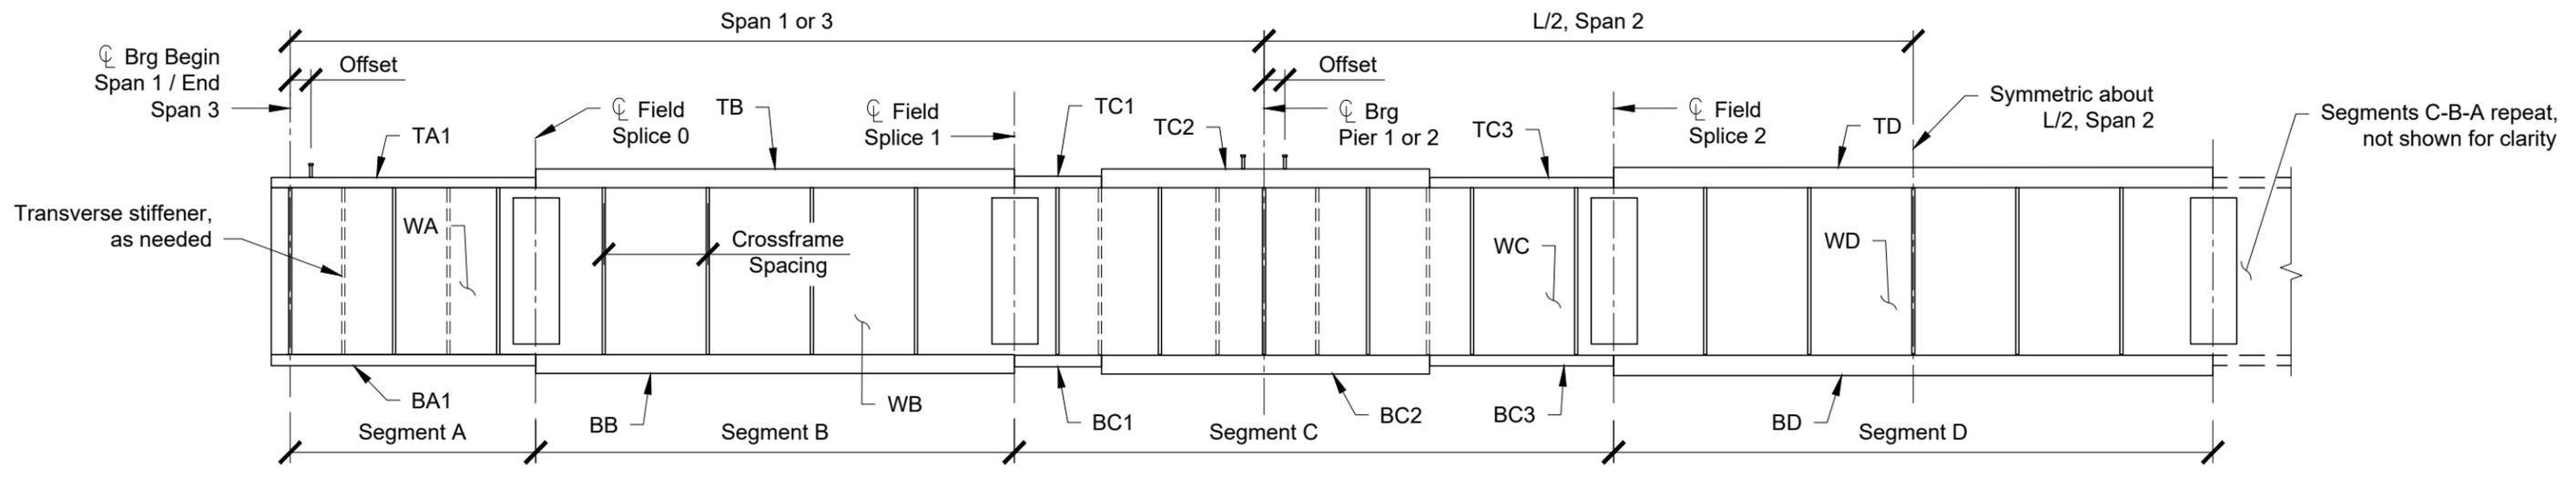

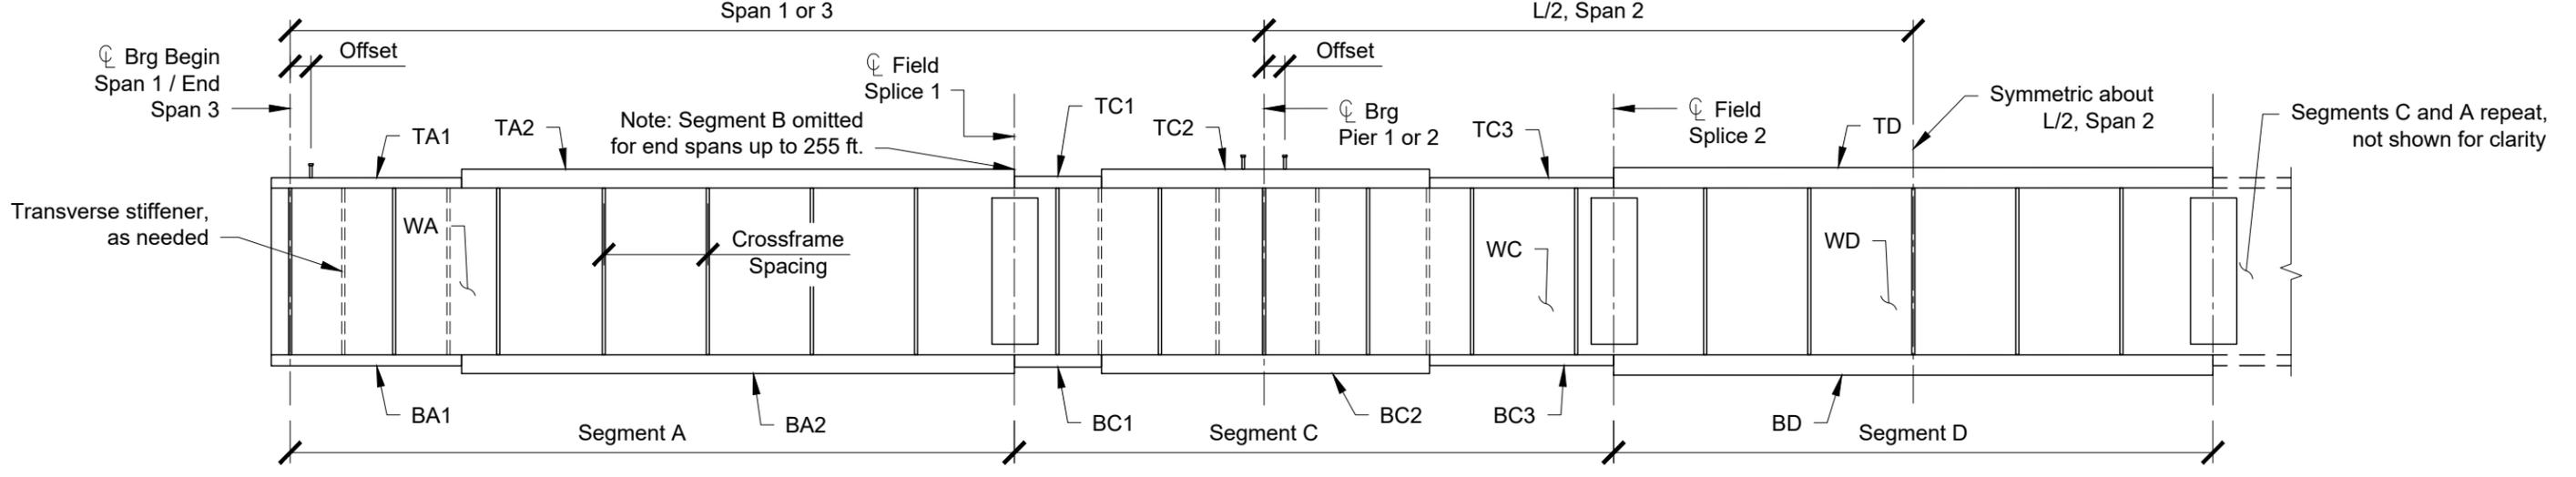

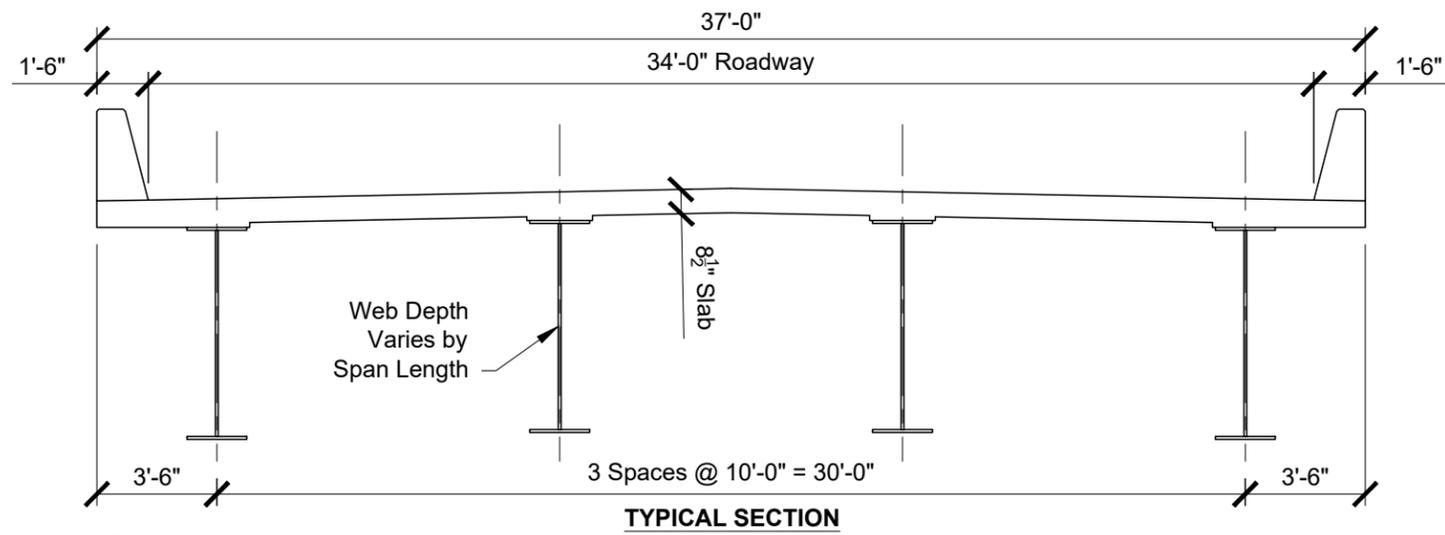

"Barrier Rails" = deflection due to barrier rail loading distributed evenly to exterior and first interior girder.

**DEFLECTION VERSUS SPAN TENTH POINT, SYMMETRIC ABOUT L/2 SPAN 2**

All Girders

Deflection Assumptions

"Steel Only" = self weight of girders

"Slab" = deflection due to user-input non composite uniform dead load (slab, haunch, allowance for bracing)

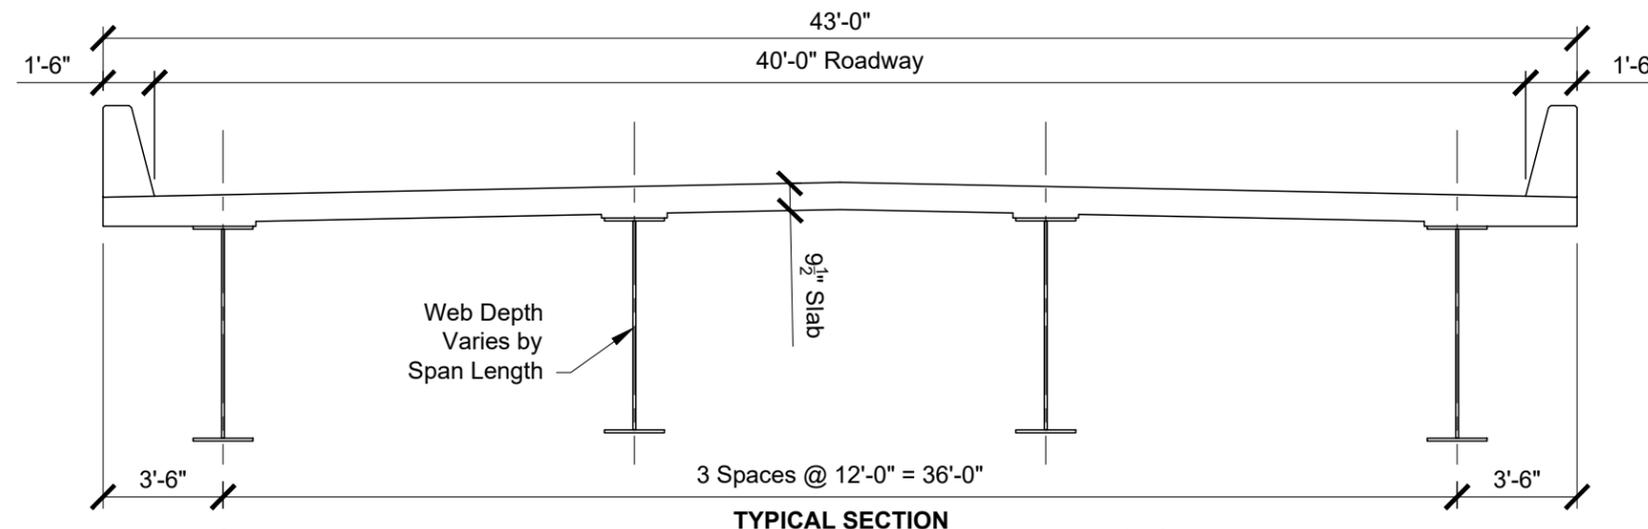

"Barrier Rails" = deflection due to barrier rail loading distributed evenly to exterior and first interior girder.

**DEFLECTION VERSUS SPAN TENTH POINT, SYMMETRIC ABOUT L/2 SPAN 2**

All Girders

**Deflection Assumptions**

"Steel Only" = self weight of girders

"Slab" = deflection due to user-input non composite uniform dead load (slab, haunch, allowance for bracing)

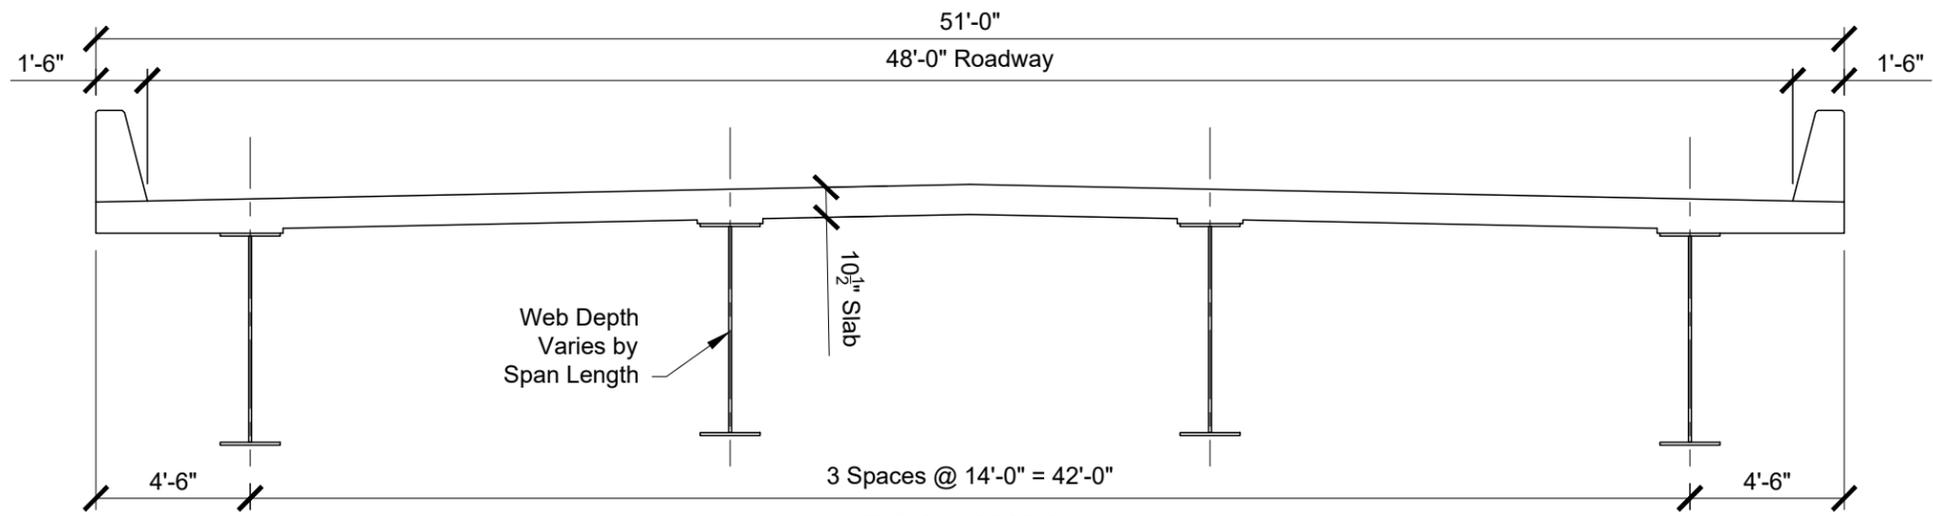

"Barrier Rails" = deflection due to barrier rail loading distributed evenly to exterior and first interior girder.

**DEFLECTION VERSUS SPAN TENTH POINT, SYMMETRIC ABOUT L/2 SPAN 2**

All Girders

**Deflection Assumptions**

"Steel Only" = self weight of girders

"Slab" = deflection due to user-input non composite uniform dead load (slab, haunch, allowance for bracing)

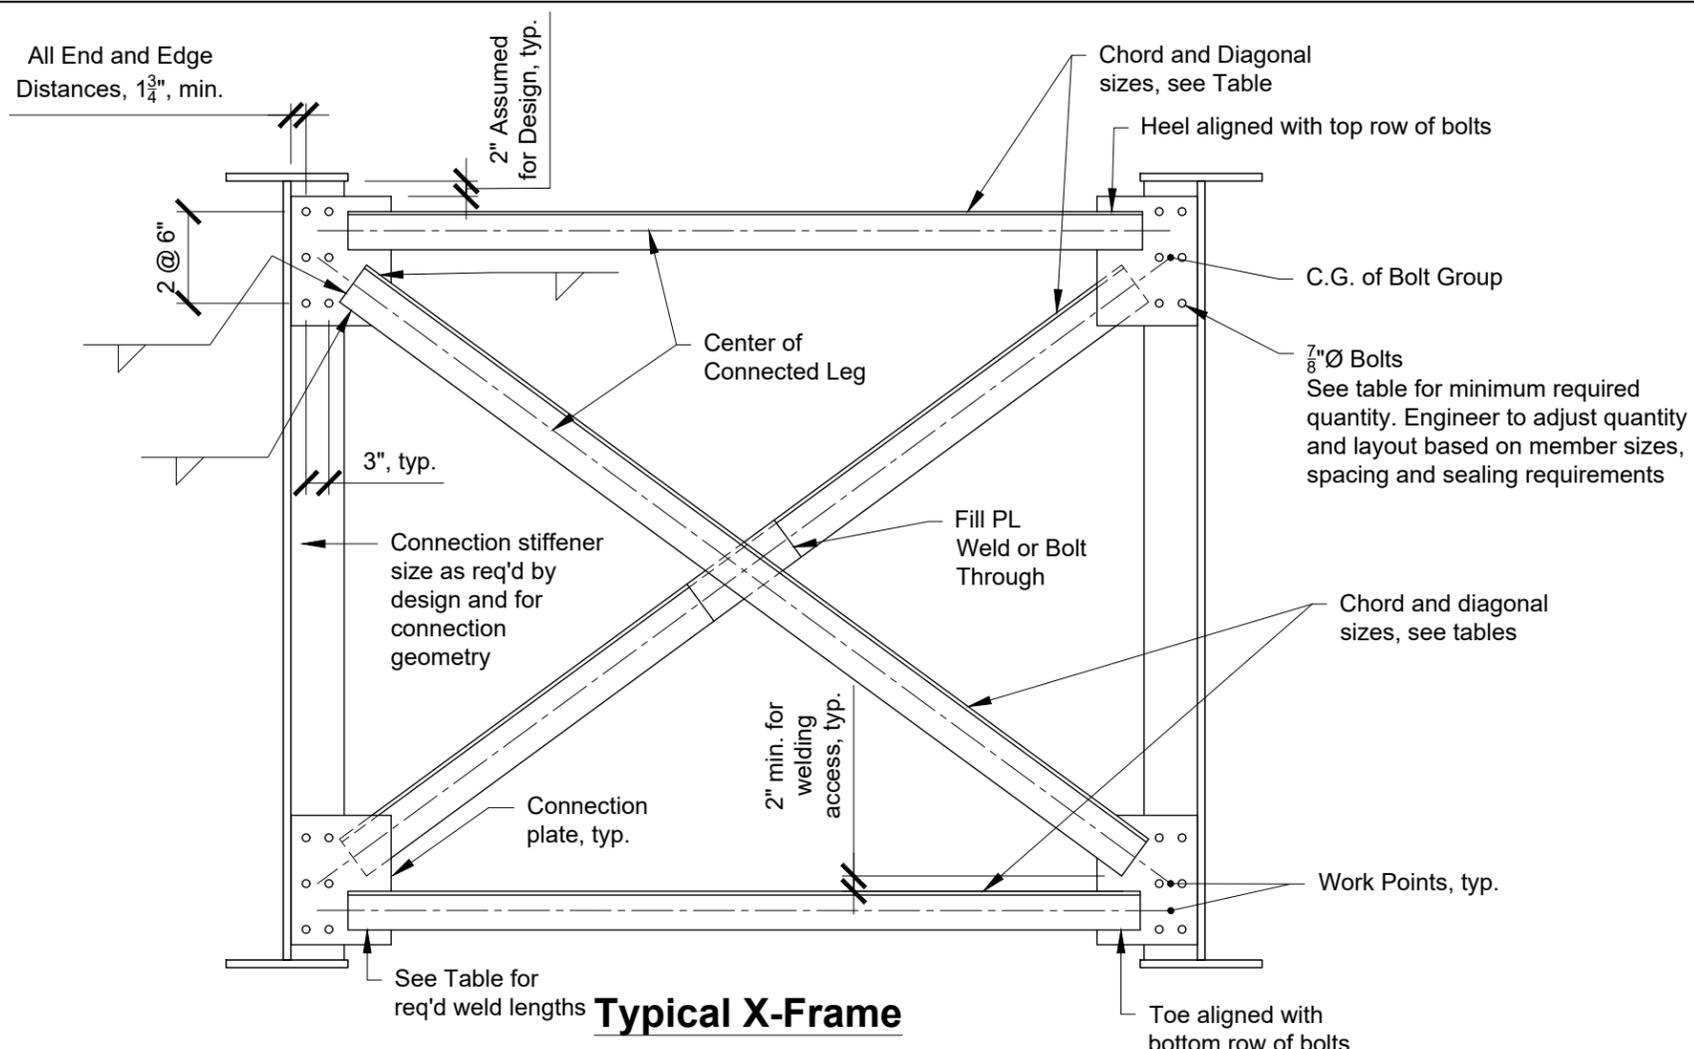

"Barrier Rails" = deflection due to barrier rail loading distributed evenly to exterior and first interior girder.

	X-Frame	6	6 in.	6	6 in.
12	K-Frame	6	6 in.	2	3 in.
14	K-Frame	8	4.75	4	4.75

- Notes:**
- All bolts for bent plate diaphragms 7/8 in. diameter ASTM F3125 Grade A325 bolts assumed in single shear with threads in the shear plane.
  - All bolts for K and X cross-frames 7/8 in. diameter ASTM F3125 Grade A325 bolts assumed in single shear with threads in the shear plane.
  - All welds 5/16 in. fillet welds. The minimum heel and toe dimensions provided meet load and eccentricity requirements. The toe may be lengthened to equal the heel dimension provided in the tables; the resulting eccentricity was considered in design. Other weld geometries may be needed for dimensional or sealing requirements and are to be designed.
  - Member and connection designs based on stability, construction, and wind forces.
  - General layout and details follow industry preferences. Provide details in accordance with owner preferences and modify these details accordingly.
  - Determine cross-frame forces for specific designs and proportion members and connections accordingly. Bolt connection layout, quantity and spacing provided on this sheet are approximate based on member loads and several representative geometries. Deck cross-slope was not considered in developing the details. Given a wide range of beam depths and spacing, the geometry of each connection was not fully studied. A scale drawing of the connection including chosen work points should be used for layout of the members, final bolt patterns, and determination of connection plate sizes. The selection of work points, member axes and orientation shown represent one acceptable approach. Engineers may choose alternate work point locations and overall connection geometries that consider the effects of eccentricity on the welded and bolted connections.

## CROSS-FRAME & DIAPHRAGM DETAILS 3

Issued January 2025  
Revision 0

Sheet 24 of 32

**NOTES:**

All bolted field splices designed using NSBA Splice Version 03\_15. Design assumptions listed below. For bolt quantity and plate dimensions, see Sheets **Bolted Field Splice Dimensions 1 - 4**.

1. Bolts F3125 Grade A325, Type 3 weathering, 1 in. diameter in 1.125 in. diameter holes. All plates A709 Grade 50W.
2. Threads excluded from flange shear planes. Threads included in web shear planes.
3. Class B surface condition for slip resistance.
4. For continuous spans in which "Splice 0" is used to control the field section lengths, a large moment must be carried by the web (AASHTO LRFD 6.13.6.1.3c). If the combined tension due to the bottom flange force plus the web force,  $H_w$ , exceeds the compression capacity of the slab, these splices are designed as noncomposite and noted in the design tables.
5. Top and bottom flange bolt group dimension, "Gage, Group" exceeds the 7 in. maximum spacing for sealing for some splices (AASHTO LRFD 6.13.2.6.2). This is due to girder tension flange net section requirements at the splice, the choice of 1 in. diameter bolts, and enforced symmetry requirements for the inner flange splice plates. The engineer may choose to accept the proposed designs, or redesign the splice. Solutions could include using asymmetric inner plates, staggered bolts, or smaller diameter fasteners. If additional and smaller diameter bolts are used to decrease the "Gage, Group" dimension, check the net section. See AASHTO LRFD 6.10.1.8.

**BOLTED FIELD SPLICE  
DIMENSIONS 4**

Issued January 2025  
Revision 0

Sheet 29 of 32

**DECK DESIGN NOTES**

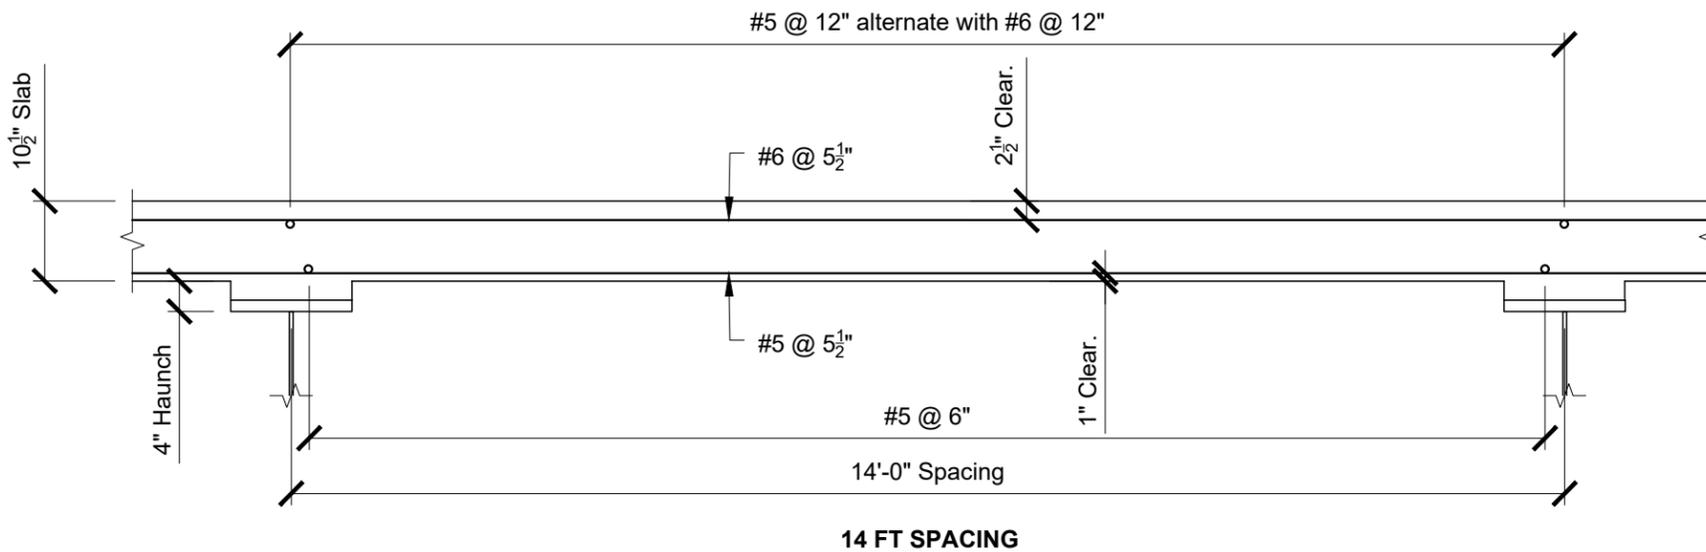

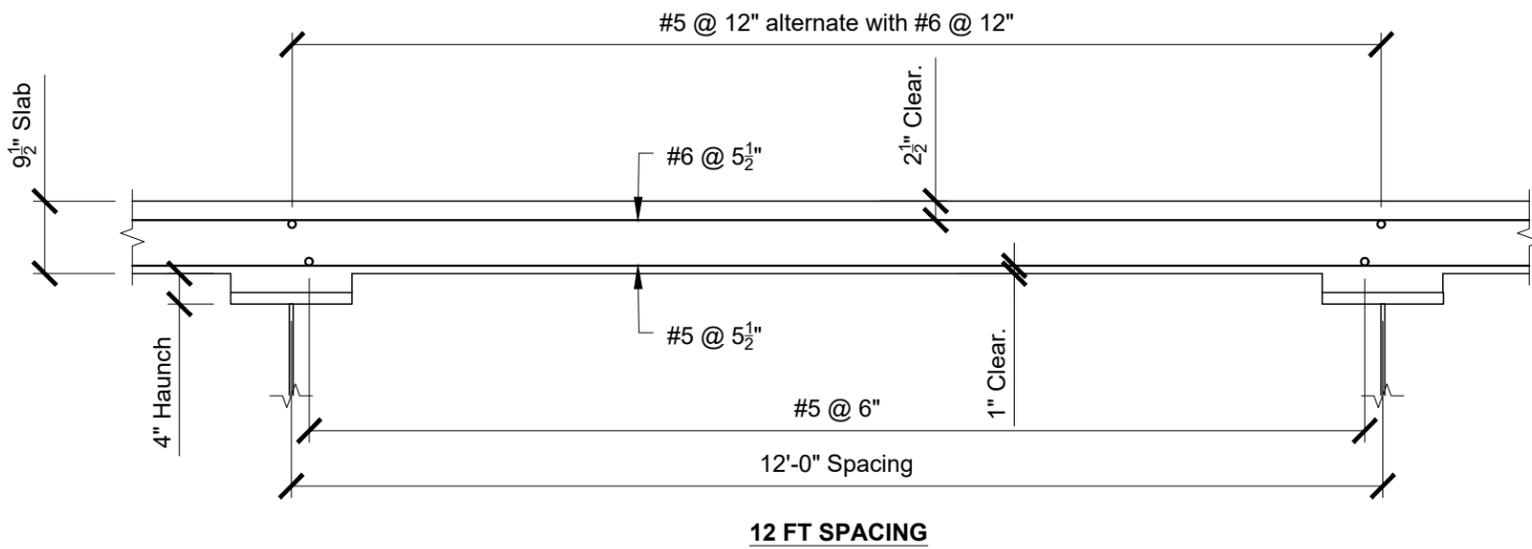

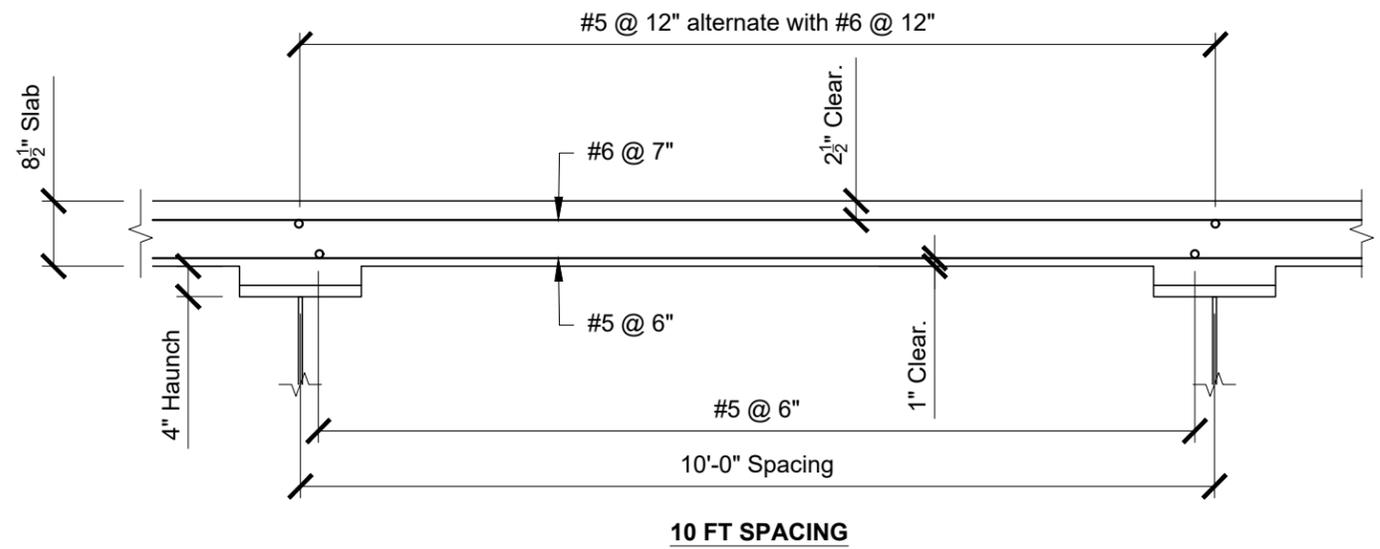

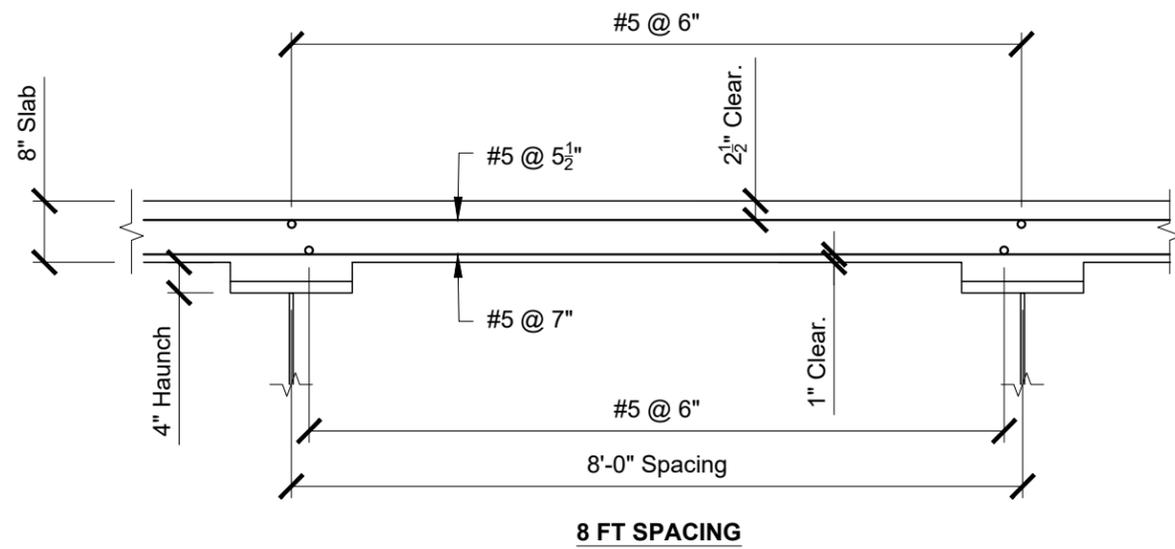

1. Deck details are representative of slab designs for the beam spacings used in these plans.
2. The gross thickness shown is used for weight calculations. Structural capacity assumes a 1/2 in. loss in deck thickness due to wear.
3. The details on this sheet are for positive moment regions of the span and represent an acceptable transverse and longitudinal reinforcing steel design complying with AASHTO LRFD 9.7.3.
4. The slab thickness, cover, bar sizes and spacing are based on decks designed using the AASHTO equivalent strip method.

Sheet 30 of 32

**DECK DESIGN NOTES**

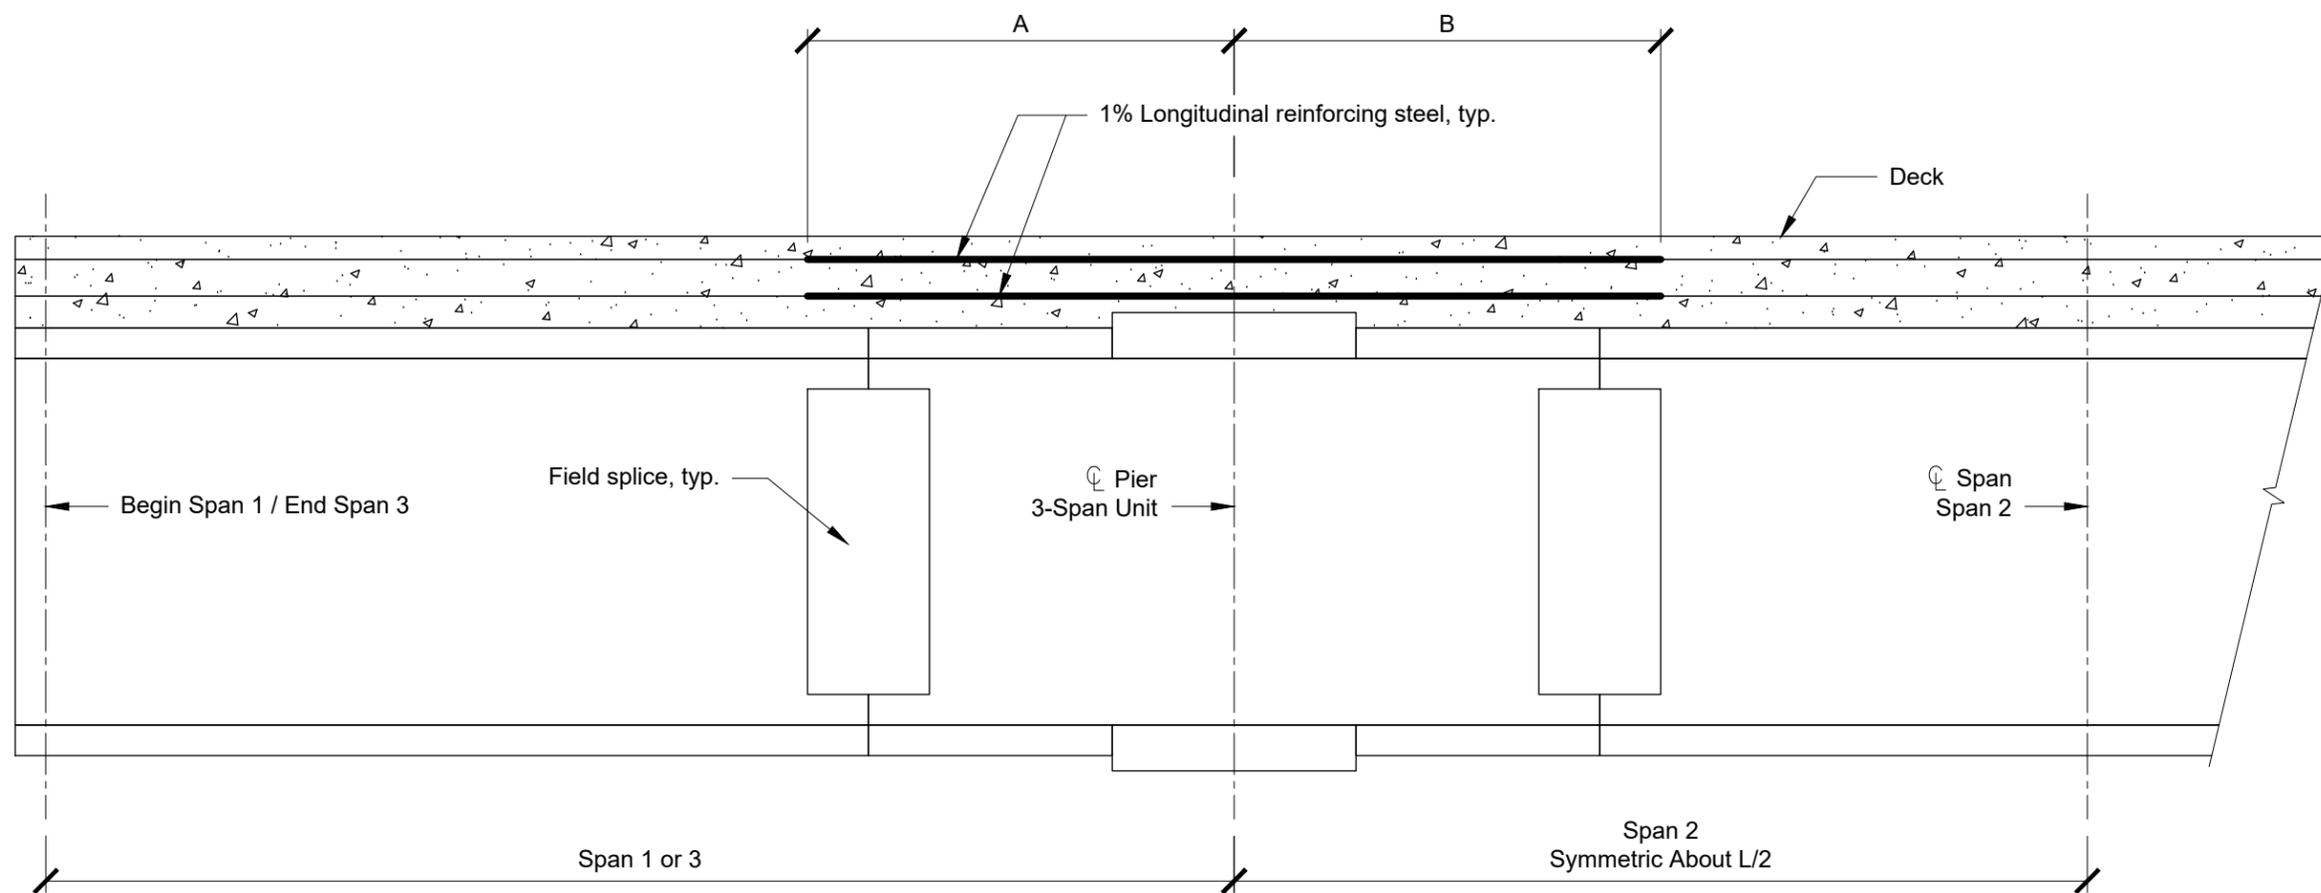

1. Deck details are representative of slab designs for the beam spacings used in these plans.
2. The gross thickness shown is used for weight calculations. Structural capacity assumes a 1/2 in. loss in deck thickness due to wear.
3. The details on this sheet are for negative moment regions of the span and represent an acceptable longitudinal reinforcing steel design complying with AASHTO LRFD 6.10.1.7.
4. The slab thickness, cover, bar sizes and spacing are based on decks designed using the AASHTO equivalent strip method.
5. Because owner policies and preferences for deck detailing vary, the negative moment region longitudinal reinforcing steel used for the beam designs is assumed to be 1%. The specific bar patterns in these plans are not used in design. The bar pattern in these plans was used to estimate the c.g. of the longitudinal reinforcing steel for negative moment region girder design.
6. See Sheet 32 **Deck Details Longitudinal Steel Termination** for cutoff limits.

Sheet 31 of 32

**LONGITUDINAL REINFORCING STEEL TERMINATION LIMITS**

**Notes:**

1. Dimension "A" defines the limit of required one percent longitudinal reinforcing steel extending from Pier 1 or 2 into either Span 1 or 3.
2. Dimension "B" defines the limit of required one percent longitudinal reinforcing steel extending from Pier 1 or 2 into Span 2.
3. Dimension "A" and "B" are at a minimum the distance to each field splice or as required by Note (4) below.
4. Longitudinal reinforcing steel is designed to meet the requirements of Service II Limit State, AASHTO LRFD 6.10.1.7 in the completed bridge only. The cutoff locations are approximate and are to be refined in final design.
5. Designer to determine if the factored deck casting and construction loads require this reinforcing steel to be extended.
6. For beam design, the longitudinal reinforcing steel was assumed to be exactly one percent and meeting the preferred two-thirds top mat placement. Sample reinforcing patterns for the positive and negative moment region longitudinal reinforcing steel are provided in the Deck Details, Sheet 30 and 31.

1% Longitudinal Steel, Distances A and B, ft.				
Versus Beam Spacing, ft.				
Span, ft.	8 ft.	10 ft.	12 ft.	14 ft.
End-Int.-End	Length A, B	Length A, B	Length A, B	Length A, B
117-150-117	43 38	38 38	38 38	38 38
129-165-129	49 42	40 40	40 40	40 40
141-180-141	53 45	47 43	43 43	43 43
153-195-153	58 52	54 47	47 47	47 47
164-210-164	61 56	59 51	59 51	56 51
176-225-176	67 61	61 54	59 54	61 54
188-240-188	71 64	70 62	69 58	67 58
199-255-199	73 69	74 67	73 65	72 61
211-270-211	78 70	81 66	78 72	78 67
223-285-223	82 79	83 77	82 73	73 73
234-300-234	86 80	86 80	86 80	78 80
